

Organization Context

Document ID: ISMS-CTX-001 | Version: 1.0 | Status: Draft for Portfolio Simulation | Date: 11 August 2026

1. Purpose

This document establishes the organizational context for the simulated ISO/IEC 27001:2022 Information Security Management System (ISMS) of TechNova Solutions Pvt. Ltd. It identifies internal and external issues that can affect the intended outcomes of the ISMS.

2. Organization Profile

Field	Description
Organization	TechNova Solutions Pvt. Ltd.
Industry	Software as a Service (SaaS) / Technology
Location	India
Employees	Approximately 75
Core services	Cloud-based business software, customer support and related digital services
Technology environment	Cloud infrastructure, SaaS applications, source-code repositories, corporate endpoints and collaboration platforms
Key information	Customer data, source code, credentials, employee information, financial information and operational records

3. Internal Issues

Key internal issues include dependence on cloud infrastructure; access to sensitive customer and business information by employees and administrators; reliance on software development and deployment processes; varying security awareness among personnel; need for controlled user access; supplier dependency; and the requirement to maintain reliable security evidence and records.

4. External Issues

Key external issues include applicable legal and regulatory requirements; customer contractual security requirements; evolving cyber threats such as phishing, ransomware and credential compromise; cloud-service and technology dependency; increasing customer expectations for security assurance; changes in technology; and the competitive SaaS market.

5. Strategic Information Security Considerations

The organization requires confidentiality, integrity and availability of information to maintain customer trust, business continuity and contractual commitments. Information security must therefore be integrated into governance, people, technology, supplier management, software development and operational processes.

6. ISMS Context Conclusion

The context indicates a need for a risk-based ISMS covering the people, processes, information, technology and supporting services that materially affect the security of TechNova's SaaS operations. The context will be reviewed when significant organizational, technological, legal or business changes occur and as part of management review.
