

Risk Treatment Report

Document Control

Document ID: ISMS-RTR-001 | Version 1.0 | Owner: ISMS Manager | Status: Draft for Portfolio Simulation | 14 August 2026

1. Purpose

This report explains how identified information-security risks are selected for treatment and how treatment decisions support the organization's security objectives.

2. Treatment Approach

TechNova primarily uses risk reduction/mitigation where risks exceed acceptable levels. Treatment considers business impact, applicable requirements, existing controls, feasibility and expected residual risk. Risk acceptance, avoidance and transfer may be used where justified.

3. Treatment Priorities

Risk Area	Treatment Direction
Customer database access	Strengthen privileged access management and monitoring
Endpoint phishing/malware	Improve endpoint protection, patching and awareness
Production availability	Strengthen redundancy, recovery and resilience testing
Source-code protection	Strengthen repository access, branch protection and secrets control
Supplier security	Formalize due diligence and contractual security requirements
Security monitoring	Centralize logs and improve alerting
Backup/recovery	Test restoration and monitor backup success

4. Residual Risk

Residual risk remains after planned controls. Each residual risk must be evaluated against the approved acceptance criteria and accepted by an authorized risk owner where appropriate.

5. Monitoring

Treatment actions are tracked to completion. The ISMS Manager monitors overdue actions, significant residual risks and changes that could alter treatment decisions.

6. Conclusion

The treatment programme provides traceability between the Risk Register, selected controls, implementation actions and residual risk. These decisions will feed into the Statement of Applicability and control implementation.
