

ISMS Documentation & Records Guide

Purpose

Folder 07 establishes the controlled-document and record structure needed to support the ISMS. It links policies and procedures to operational records and audit evidence.

Document hierarchy

A practical ISMS library can be organized as: policies → standards → procedures → forms/templates → operational records → reports. Policies define direction; procedures define how work is performed; records demonstrate that work occurred.

Document control

Every controlled document should have an owner, version, approval, effective date, review date, status and revision history. Obsolete documents should be prevented from unintended use.

Records management

Records should be identifiable, protected, retrievable and retained for an appropriate period. Security-sensitive records should have access restrictions.

Auditor perspective

Auditors commonly sample documents and records to test whether the ISMS is established, implemented and maintained. They may compare approved procedures with actual records and interview responsible personnel.

Connection to earlier folders

Folder 07 supports Folder 06 control implementation and creates the documentary foundation for Folder 08 — Operational Records & Evidence.

Portfolio limitation

The register is a simulated portfolio framework. Actual organizations must set retention periods, approval authorities and document content according to their own legal, contractual and operational requirements.
